

## Stadteatr, Malmö

2012

The Malmö city teater was originally an old circus with horses. Nowadays the building is transformed with a regular auditorium, but still in the shape of a horseshoe. In the ceiling of the auditorium and stage area a hoisting installation of 52 tracked point hoists is installed . The winches are placed in a separate winch room.

The renovation of the installation was purely exchange of the control system, because the drives and the rest of the mechanical sled system was still in excellent condition.

Critical in the client's decision for Trekwerk was simplicity and power full TNM software to operate, group, change and varying the point hoists with groups and shows.

### Implemented Products

TNM Control System
